

wayworks.space

On the work layer,

wayworks is the work layer of the DebugInit ecosystem: people, teams, workflows, operations, communication, execution. It is the layer every organisation already has, whether or not it has ever bought software for it.

What makes it different from the category is what it asks you to open, which is nothing. It connects to Claude and ChatGPT over MCP, so the ask happens in the assistant already on your screen and the work happens underneath it. The status is read from the work rather than typed by somebody on a Friday.

It is also an address rather than an account. Your organisation holds a space at a location you choose, on infrastructure you picked. Ours, your own domain, or your own cloud — the same product at a different address.

This is the one product in the ecosystem you can use today. Everything in the letters beside it is honest about being further back.

With regards,

DebugInit
